Human Zirconium Technology

100% BIOLOGICAL – MADE BY CAD/CAM

“Ready to face the future” Enrico Steger

100% TENNESSEE OAK

Dental bridges made of genuine, Tennessee oak are especially suitable for ecologically motivated persons and high-sensitive patients with latent ceramic and metal allergies, since it offers a precise fit with no chemical additives and irritants.

For the realisation of this complete denture, the tree was cut down when the moon was waning, since the saps then shift towards the roots and the diameter of the trunk shrinks. The wood is drier and this results in less fissures and joints so that the longevity of the bridge is guaranteed. With the software, there are no limits to the aesthetic design. Manufactured with high precision, the bridges can also be lime-washed or soaked in beeswax.

On special request, the work can also be milled in smoked oak.

Oak, lime-washed
